PM25CLB120

FEATURE

- a) Adopting new 5th generation IGBT (CSTBT) chip, which performance is improved by 1 μ m fine rule process.
For example, typical $V_{ce(sat)}=1.9V$ @ $T_j=125^\circ C$
- b) I adopt the over-temperature conservation by T_j detection of CSTBT chip, and error output is possible from all each conservation upper and lower arm of IPM.
- 3 ϕ 25A, 1200V Current-sense IGBT type inverter
- Monolithic gate drive & protection logic
- Detection, protection & status indication circuits for, short-circuit, over-temperature & under-voltage (P-Fo available from upper arm devices)
- Acoustic noise-less 3.7kW class inverter application
- UL Recognized Yellow Card No.E80276(N)
File No.E80271

APPLICATION

General purpose inverter, servo drives and other motor controls

PRECAUTIONS FOR TESTING

1. Before applying any control supply voltage (V_D), the input terminals should be pulled up by resistors, etc. to their corresponding supply voltage and each input signal should be kept off state.
After this, the specified ON and OFF level setting for each input signal should be done.
2. When performing "SC" tests, the turn-off surge voltage spike at the corresponding protection operation should not be allowed to rise above V_{CES} rating of the device.
(These test should not be done by using a curve tracer or its equivalent.)

1.5V: Input on threshold voltage $V_{th(on)}$ typical value, 2V: Input off threshold voltage $V_{th(off)}$ typical value
