

SN54LS422, SN54LS423, SN74LS422, SN74LS423 RETRIGGERABLE MONOSTABLE MULTIVIBRATORS

SDLS175 D2536, JANUARY 1980 — REVISED MARCH 1988

- Will Not Trigger from Clear
- D-C Triggered from Active-High or Active-Low Gated Logic Inputs
- Retriggerable for Very Long Output Pulses, Up to 100% Duty Cycle
- Overriding Clear Terminates Output Pulse
- 'LS422 Has Internal Timing Resistor

description

The 'LS422 and 'LS423 are identical to 'LS122 and 'LS123 except they cannot be triggered via clear.

These d-c triggered multivibrators feature output-pulse-width control by three methods. The basic pulse time is programmed by selection of external resistance and capacitance values (see typical application data). The 'LS422 contains an internal timing resistor that allows the circuits to be used with only an external capacitor, if so desired. Once triggered, the basic pulse width may be extended by retriggering the gated low-level-active (A) or high-level-active (B) inputs, or be reduced by use of the overriding clear. Figure 1 illustrates pulse control by retriggering and early clear.

The 'LS422 and 'LS423 have enough Schmitt hysteresis to ensure jitter-free triggering from the B input with transition rates as slow as 0.1 millivolt per nanosecond. The 'LS422 R_{int} is nominally 10 k ohms.

The SN54LS422 and SN54LS423 are characterized for operation over the full military temperature range of -55°C to 125°C . The SN74LS422 and SN74LS423 are characterized for operation from 0°C to 70°C .

SN54LS423 . . . FK PACKAGE
(TOP VIEW) (SEE NOTES 1 THRU 4)

- NOTES: 1. An external timing capacitor may be connected between C_{ext} and R_{ext}/C_{ext} (positive).
 2. To use the internal timing resistor of 'LS422, connect R_{int} to V_{CC} .
 3. For improved pulse width accuracy and repeatability, connect an external resistor between R_{ext}/C_{ext} and V_{CC} with R_{int} open-circuited.
 4. To obtain variable pulse widths, connect an external variable resistance between R_{int} or R_{ext}/C_{ext} and V_{CC} .

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

† These lines of the functional tables assume that the indicated steady-state conditions at the A and B inputs have been set up long enough to complete any pulse started before the set up.

NOTE: Retrigger pulses starting before $0.22 C_{ext}$ (in picofrads) nanoseconds after the initial trigger pulse will be ignored and the output pulse will remain unchanged.

I_{OS} Short-circuit output current §	$V_{CC} = \text{MAX}$	-20		-100	-20		-100	mA	
I_{CC} Supply current (quiescent or triggered)	$V_{CC} = \text{MAX}$, See Note 6			6	11		6	11	mA
				12	20		12	20	

† For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.

‡ All typical values are at $V_{CC} = 5 \text{ V}$, $T_A = 25^{\circ}\text{C}$.

§ Not more than one output should be shorted at a time and duration of the short-circuit should not exceed one second.

NOTES: 5. To measure V_{OH} at Q, V_{OL} at \bar{Q} , or I_{OS} at Q, ground R_{ext}/C_{ext} , apply 2 V to B and clear, and pulse A from 2 V to 0 V.
6. With all outputs open and 4.5 V applied to all data and clear inputs, I_{CC} is measured after a momentary ground, then 4.5 V, is applied to clock.

switching characteristics, $V_{CC} = 5 \text{ V}$, $T_A = 25^{\circ}\text{C}$, see note 7

PARAMETER¶	FROM (INPUT)	TO (OUTPUT)	TEST CONDITIONS	MIN	TYP	MAX	UNIT

SN54LS422, SN54LS423, SN74LS422, SN74LS423 RETRIGGERABLE MONOSTABLE MULTIVIBRATORS

TYPICAL APPLICATION DATA FOR 'LS422, 'LS423†

The basic output pulse width is essentially determined by the values of external capacitance and timing resistance. For pulse widths when $C_{ext} \leq 1000$ pF, use Figure 3. For C_{ext} between 0.1 nF and 1 μ F, the pulse width may be defined as:

$$t_w \approx K \cdot R_T \cdot C_{ext}$$

with K obtained from Figure 4.

When $C_{ext} \geq 1$ μ F, the output pulse width is defined as:

$$t_w \approx 0.33 \cdot R_T \cdot C_{ext}$$

Where

R_T is in kilohms (internal or external timing resistance)

C_{ext} is in pF

t_w is in nanoseconds

For maximum noise immunity, system ground should be applied to the C_{ext} node, even though the C_{ext} node is already tied to the ground lead internally. Due to the timing scheme used by the 'LS422 and 'LS423, a switching diode is not required to prevent reverse biasing when using electrolytic capacitors.
