MC13821

Low Noise Amplifier with Bypass Switch

Package Information
Plastic Package
Case 1345
(QFN–12)

Ordering Information

Device	Device Marking or Operating Temperature Range	Package
MC13821	821	QFN-12

1   Introduction

The MC13821 is a high gain LNA with extremely low noise figure, designed for cellular, GPS and ISM band applications. An integrated bypass switch is included to preserve input intercept performance. The input and output match are external to allow maximum design flexibility. The MC13821 is fabricated using Freescale's advanced RF BiCMOS process using the SiGe:C option and is packaged in the QFN-12 leadless package.

1.1   Features

- RF Input Frequency: 1000 MHz to 2.4 GHz
- Gain: 16.4 dB (typ) at 1960 MHz and 15.7 dB (typ) at 2140 MHz
- Output 3rd Order Intercept Point (OIP3): 17.4 dBm (typ) at 1960 MHz and 19.7 dBm (typ) at 2140 MHz
- Noise Figure (NF): 1.25 dB (typ) at 1960 MHz and 1.3 dB (typ) at 2140 MHz
- 1dB Compression Point (P1dB): -6 dBm (typ) at 1960 MHz and -5 dBm (typ) at 2140 MHz

2 Electrical Specifications

Table 1. Maximum Ratings

Ratings	Symbol	Minimum	Typical	Maximum	Unit
Supply Voltage	V_{CC}	2.7	2.75	3.3	V
Storage Temperature Range	T_{stg}	-65	25	150	°C
Operating Ambient Temperature Range	T_A	-30	25	85	°C
RF Input Power	P_{rf}	—	-30	10	dBm
Power Dissipation	P_{dis}	—	—	100	mW
Thermal Resistance, Junction to Case	$R_{\theta JC}$	24	24	24	C/W
Thermal Resistance, Junction to Ambient, 4 Layer Board	$R_{\theta JA}$	90	90	90	C/W

NOTES: 1. Maximum Ratings are those values beyond which damage to the device may occur.
Functional operation should be restricted to the limits in the Recommended Operating
Conditions and Electrical Characteristics tables.
2. ESD (electrostatic discharge) immunity meets Human Body Model (HBM) ≤200 V, Charge Device Model (CDM) ≤450 V, and
Machine Model (MM) ≤50 V. Additional ESD data available upon request.

Table 2. Recommended Operating Conditions

Table 5. Truth Table

Pin Function	Pin Name	Enable		Disable	
		Low Gain	High Gain	Low Gain	High Gain
Circuit Bias VCC1	VCC1	1	1	1	1
Toggles Gain Mode (Active or Bypass)	GAIN	0	1	0	1
Toggles LNA On/Off	ENABLE	1	1	0	0
LNA Bias VCC3	LNA Out	1	1	1	1

NOTES: 1. Logic state "1" equals V_{CC} voltage. Logic state of "0" equals ground potential.
2. VCC3 is inductively coupled to LNA OUT pin
3. Minimum logic state "1" for enable and gain pins is 1.25 V.
4. Minimum logic state "0" for enable and gain pins is 0.8 V.

3 Application Information

The MC13821 SiGe:C LNA is designed for applications in the 1000 MHz to 2.4 GHz range. It has three different modes: High Gain, Low Gain (Bypass) and Disabled. The IC is programmable through the Gain and Enable pins. The logic truth table is given in Table 5.

In these application examples a balance is made between the competing RF performance characteristics of I_{CC}, NF, gain, IP3 and return losses with unconditional stability. Conjugate matching is not used for the input or output. Instead, matching which achieves a trade-off in RF performance qualities is utilized. For a particular application or spec requirement, the matching can be changed to achieve enhanced performance of one parameter at the expense of other parameters.

Application information for 1575, 1960, 2140 and 2400 MHz are shown. For each application, two current drain examples are provided. Typical RF performance is shown for two values of bias resistor R1: 1.2 kΩ and 2 kΩ, see Table 6, Table 7, Table 8, and Table 9. These two current drain states offer variation in intercept point, gain, and noise figure. For 1960 and 2140 MHz, additional application circuits are shown. These demonstrate specific performance characteristics and utilize varying input and output matches and different biasing resistors.

Measurements are made at a bias of V_{CC} = 2.75 V. Freq. spacing for IP3 measurements is 200 kHz. Non-linear measurements are made at Pin = -30 dB. The board loss corrections for these boards are: Input 0.16 dB, Output 0.2 dB. Gain and NF results incorporate these corrections in order to better reflect the actual performance of the device.

3.1   1575 MHz Application

This application circuit was designed to provide NF < 1.2 dB, S21 gain > 18 dB, OIP3 of 18 dBm with S11 better than -10 dB and S22 better than -10 dB at 1575 MHz with unconditional stability from 100 MHz to 10 GHz. Typical performance that can be expected from this circuit at 2.75 V V_{CC} is listed in Table 6. The component values can be changed to enhance the performance of a particular parameter, but usually at the expense of another. Two variations of the circuit are realized for different requirements for IP3 and I_{CC}. Values of external resistors R1 and R2 are varied to adjust I_{CC} and IP3.

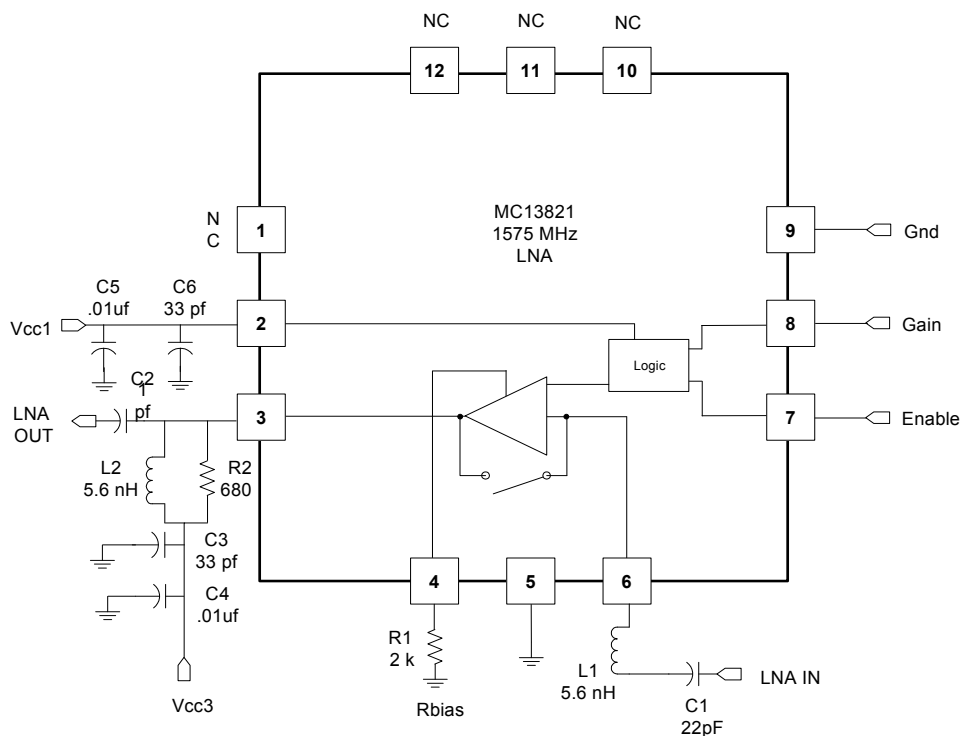

Figure 9. 1575 MHz LNA Application Schematic

MC13821 Data Sheet: Technical Data, Rev. 1.5

3.2   1960 MHz Application

These application circuits are designed to demonstrate performance at 1960 MHz. By varying the value of resistor R1, the current draw and the IP3 performance of the device can be tailored for a particular application. Shown here are four variations of the circuit for different IP3 and I_{CC} requirements. The input and output matches are also changed on some circuits to demonstrate different NF and gain performance. Typical performance that can be expected from this circuit at 2.75 V V_{CC} is listed in Table 7. Two variations of the circuit utilize different matches. For all circuits the match consists of a highpass match on the output and a simple inductor-capacitor network on the LNA input.

3.3   2140 MHz Application

These application circuits demonstrate performance at 2140 MHz. Resistor values for R1 and R2 are varied to adjust I_{CC}, which also adjusts IP3 performance. Matching component values can be changed to enhance a particular parameter, but usually at the expense of another. Typical performance that can be expected from this circuit at 2.75 V V_{CC} is listed in Table 8. Three variations of the circuit are realized for different requirements for IP3 and I_{CC}. The same matching networks are used on the 2140 MHz circuit as on the 1960 MHz application circuit, with a highpass match on the output and a simple inductor-capacitor network on the LNA input.

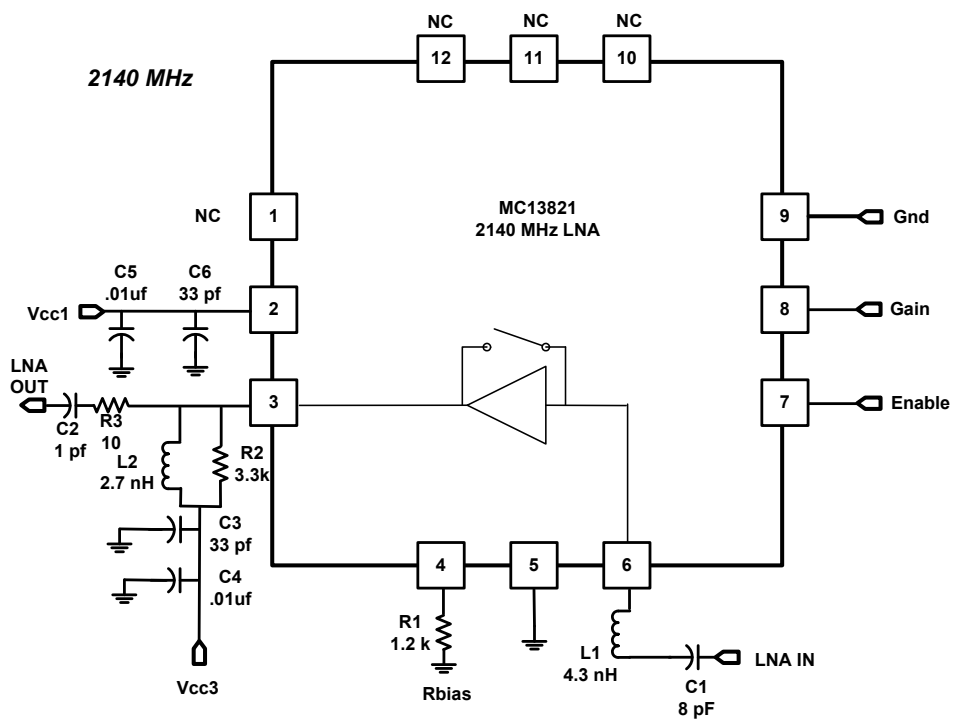

Figure 12. 2140 MHz LNA Application Schematic with R3 Output Resistor Added

3.4   2400 MHz Application

This application circuit was designed to provide NF < 1.3 dB, S21 gain > 16 dB, OIP3 of 18 dBm with S11 better than -10 dB and S22 better than -10 dB at 2140 MHz with unconditional stability from 100 MHz to 10 GHz. Typical performance that can be expected from this circuit at 2.75 V V_{CC} is listed in Table 9. The component values can be changed to enhance the performance of a particular parameter, but usually at the expense of another. Two variations of the circuit are realized for different requirements for IP3 and I_{CC}. Values of external resistors R1 and R2 are varied to adjust I_{CC} and IP3.

Table 10. Bill of Materials (continued)

Component	Value	Case	Manufacturer	Comments
C6	33 pF	402	Murata	RF bypass
L1	4.3 nH	1005	CoilCraft	Input match
L2	2.7 nH	1005	CoilCraft	Output match
R1	1.2 kΩ	402	KOA	Bias for 5.5 mA
R2	3.3 kΩ	402	KOA	Stability
R3	10 Ω	402	KOA	Stability
Q1	MC13821	QFN-12	Freescale	
2140 MHz (Refer to Figure 11)				
C1	33 pF	402	Murata	Input match
C2	1.0 pF	402	Taiyo Yuden	Output match
C3	33 pF	402	Murata	RF bypass
C4	.01 µF	402	Murata	Low freq bypass
C5	.01 µF	402	Murata	Low freq bypass
C6	33 pF	402	Murata	RF bypass
L1	4.3 nH	1005	CoilCraft	Input match
L2	2.7 nH	1005	Coilcraft	Output match
R1	1.5 kΩ	402	KOA	Bias for 4.45 mA
R2	10 kΩ	402	KOA	Stability
Q1	MC13821	QFN-12	Freescale	
2400 MHz				
C1	33 pF	402	Murata	Input match
C2	0.6 pF	402	Taiyo Yuden	Output match
C3	33 pF	402	Murata	RF bypass
C4	.01 µF	402	Murata	Low freq bypass
C5	.01 µF	402	Murata	Low freq bypass
C6	33 pF	402	Murata	RF bypass
L1	2.7 nH	1005	CoilCraft	Input match
L2	2.4 nH	1005	CoilCraft	Output match
R2	3.3 kΩ	402	KOA	Stability
R1	1.2 or 2 kΩ	402	KOA	Bias for 4.5 or 2.8 mA
Q1	MC13821	QFN-12	Freescale	

5   Scattering Parameters

Table 11. Active Mode Scattering Parameters

(V$_{CC1}$ and V$_{CC3}$ = 2.75 V, Band grounded, Gain = 2.75 V, Enable = 2.75 V, Rbias resistor R1 = 2 kΩ), I$_{CC}$ = 2.6 mA

7   Reference Documentation

This data sheet is labeled as a particular type: Product Preview, Advance Information, or Technical Data. Definitions of these types are available at: http://www.freescale.com.

8   Revision History

Table 17 summarizes revisions to this document since the previous release (Rev. 1.4).

Table 17. Revision History

Location	Revision
Throughout	Changed document type from "Advance Information" to" Technical Data."

RoHS-compliant and/or Pb-free versions of Freescale products have the functionality and electrical characteristics of their non-RoHS-compliant and/or non-Pb-free counterparts. For further information, see http://www.freescale.com or contact your Freescale sales representative.

For information on Freescale's Environmental Products program, go to http://www.freescale.com/epp.
